Computational Subsurface Hydrology - Reactions, Transport, and Fate

Gour-Tsyh (George) Yeh

Computational Subsurface Hydrology - Reactions, Transport, and Fate Gour-Tsyh (George) Yeh

Any numerical subsurface model is comprised of three components: a theoretical basis to translate our understanding phenomena into partial differential equations and boundary conditions, a numerical method to approximate these governing equations and implement the boundary conditions, and a computer implementation to generate a generic code for research as well as for practical applications. *Computational Subsurface Hydrology: Reactions, Transport, and Fate* is organized around these themes.

The fundamental processes occurring in subsurface media are rigorously integrated into governing equations using the Reynolds transport theorem and interactions of these processes with the surrounding media are sophisticatedly cast into various types of boundary conditions using physical reasoning. A variety of numerical methods to deal with reactive chemical transport are covered in *Computational Subsurface Hydrology: Reactions, Transport, and Fate* with a particular emphasis on the adaptive local grid refinement and peak capture using the Lagrangian-Eulerian approach. The topics on coupled fluid flows and reactive chemical transport are unique contributions of this book. They serve as a reference for research as well as for practical applications with a computer code that can be purchased from the author.

Four computer codes to simulate vertically integrated horizontal solute transport (LEMA), contaminant transport in moving phreatic aquifers in three dimensions (3DLEMA), solute transport in variably saturated flows in two dimensions (LEWASTE), and solute transport under variably saturated flows in three dimensions (3DLEWASTE) are covered. These four computer codes are designed for generic applications to both research and practical problems. They could be used to simulate most of the practical, real-world field problems.

Reactive chemical transport and its coupling with fluid flows are unique features in this book. Theories, numerical implementations, and example problems of coupled reactive transport and flows in variably saturated media are presented. A generic computer code, HYDROGEOCHEM 3.0, is developed. A total of eight example problems are used to illustrate the application of the computational model. These problems are intended to serve as examples for setting up a variety of simulations that one may encounter in research and field-site applications.

Computational Subsurface Hydrology: Reactions, Transport, and Fate offers practicing engineers and scientists a theoretical background, numerical methods, and computer codes for modeling contaminant transport in subsurface media. It also serves as a textbook for senior and graduate course on reactive chemical transport in subsurface media in disciplines such as civil and environmental engineering, agricultural engineering, geosciences, soil sciences, and chemical engineering.

Computational Subsurface Hydrology: Reactions, Transport, and Fate presents a systematic derivation of governing equations and boundary conditions of subsurface contaminant transport as well as reaction-based geochemical and biochemical processes. It discusses a variety of numerical methods for moving sharp-front problems, expounds detail procedures of constructing Lagrangian-Eulerian finite element methods, and describes precise implementation of computer codes as they are applied to subsurface contaminant transport and biogeochemical reactions.

From reader reviews:

Byron Jorgensen:

As people who live in the modest era should be revise about what going on or data even knowledge to make these individuals keep up with the era which can be always change and progress. Some of you maybe will probably update themselves by looking at books. It is a good choice to suit your needs but the problems coming to an individual is you don't know what kind you should start with. This Computational Subsurface Hydrology - Reactions, Transport, and Fate is our recommendation to help you keep up with the world. Why, because book serves what you want and want in this era.

Marcia Eberhart:

Spent a free a chance to be fun activity to try and do! A lot of people spent their free time with their family, or all their friends. Usually they accomplishing activity like watching television, gonna beach, or picnic from the park. They actually doing same task every week. Do you feel it? Do you want to something different to fill your free time/ holiday? May be reading a book is usually option to fill your no cost time/ holiday. The first thing you ask may be what kinds of guide that you should read. If you want to attempt look for book, may be the publication untitled Computational Subsurface Hydrology - Reactions, Transport, and Fate can be great book to read. May be it might be best activity to you.

Eden Davis:

A lot of people always spent their particular free time to vacation or maybe go to the outside with them friends and family or their friend. Were you aware? Many a lot of people spent they free time just watching TV, or maybe playing video games all day long. If you need to try to find a new activity honestly, that is look different you can read the book. It is really fun to suit your needs. If you enjoy the book you read you can spent all day long to reading a e-book. The book Computational Subsurface Hydrology - Reactions, Transport, and Fate it is rather good to read. There are a lot of those who recommended this book. We were holding enjoying reading this book. In case you did not have enough space to develop this book you can buy the e-book. You can m0ore very easily to read this book from the smart phone. The price is not very costly but this book offers high quality.

David Shields:

Reading a book being new life style in this calendar year; every people loves to examine a book. When you go through a book you can get a wide range of benefit. When you read ebooks, you can improve your knowledge, because book has a lot of information upon it. The information that you will get depend on what sorts of book that you have read. If you want to get information about your examine, you can read education books, but if you want to entertain yourself you are able to a fiction books, such us novel, comics, and also soon. The Computational Subsurface Hydrology - Reactions, Transport, and Fate provide you with new experience in examining a book.
