Histological Typing of Thyroid Tumours (WHO. World Health Organization. International Histological Classification of Tumours) Christoph Hedinger

Knowledge of tumours of the thyroid gland has advanced considerably in the 22 years that have elapsed since work was started on the first edition of Histological Typing of Thyroid Tumours. In the introduction to that volume it was recognized that the definitions and classifications put forward would need revision in time, and the present text differs substantially from the first edition. As far as is possible, however, the framework of the classification proposed remains the same, as the original classification was widely accepted and proved useful in many studies. The link between the morphological type of thyroid tumour and its epidemiology, natural history, function, prognosis and response to therapy has been further strengthened since the first edition. In particular, the decision taken to separate papillary and follicular carcinomas and exclude a mixed papillary follicular type has been well justified. One of the major changes has been the recognition that many tumours regarded 20 years ago as small cell carcinoma were really malignant lymphoma, and this development has been incorporated into this edition, with increased importance given to primary malignant lymphoma of the thyroid. Much work has also been done on medullary carcinoma of the thyroid, its link with multiple endocrine neoplasia syndromes, and its association in its inherited form with C-cell hyperplasia; this too is recognized by an expanded section on this tumour.
